General

- One of the applications of Stack is in the conversion of arithmetic expressions in high-level programming languages into machine readable form. As our computer system can only understand and work on a binary language, it assumes that an arithmetic operation can take place in two operands only e.g., $A+B$, $C*D$, D/A etc. But in our usual form an arithmetic expression may consist of more than one operator and two operands e.g. $(A+B)*C(D/(J+D))$.
- These complex arithmetic operations can be converted into polish notation using stacks which then can be executed in two operands and an operator form.

Infix & Postfix

❑ Infix Expression

- It follows the scheme of **<operand><operator><operand>** i.e. an **<operator>** is preceded and succeeded by an **<operand>**. Such an expression is termed infix expression. E.g., **A+B**

❑ Postfix Expression

- It follows the scheme of **<operand><operand><operator>** i.e. an **<operator>** is succeeded by both the **<operand>**. E.g., **AB+**

Advantage of Postfix Expression

❑ Advantage of Postfix Expression over Infix Expression

- An infix expression is difficult for the machine to know and keep track of precedence of operators. On the other hand, a postfix expression itself determines the precedence of operators (as the placement of operators in a postfix expression depends upon its precedence). Therefore, for the machine it is easier to carry out a postfix expression than an infix expression.

Algorithm to convert Infix To Postfix

Let, X is an arithmetic expression written in infix notation. This algorithm finds the equivalent postfix expression Y.

1. Push “(“ onto Stack, and add “)” to the end of X.
2. Scan X from left to right and repeat Step 3 to 6 for each element of X until the Stack is empty.
3. If an operand is encountered, add it to Y.
4. If a left parenthesis is encountered, push it onto Stack.
5. If an operator is encountered ,then:
 1. Repeatedly pop from Stack and add to Y each operator (on the top of Stack) which has the same precedence as or higher precedence than operator.
 2. Add operator to Stack.
[End of If]
6. If a right parenthesis is encountered ,then:
 1. Repeatedly pop from Stack and add to Y each operator (on the top of Stack) until a left parenthesis is encountered.
 2. Remove the left Parenthesis.
[End of If]
[End of If]

Infix to Postfix conversion

Infix Expression: $A + (B * C - (D / E ^ F) * G) * H$, where $^$ is an exponential operator.

Symbol	Scanned	STACK	Postfix Expression	Description
1.		(Start
2.	A	(A	
3.	+	(+	A	
4.	((+ (A	
5.	B	(+ (AB	
6.	*	(+ (*	AB	
7.	C	(+ (*	ABC	
8.	-	(+ (-	ABC*	'*' is at higher precedence than '-'
9.	((+ (- (ABC*	
10.	D	(+ (- (ABC*D	
11.	/	(+ (- (/	ABC*D	
12.	E	(+ (- (/	ABC*DE	
13.	^	(+ (- (/ ^	ABC*DE	
14.	F	(+ (- (/ ^	ABC*DEF	
15.)	(+ (-	ABC*DEF^/	Pop from top on Stack , that's why '^' Come first
16.	*	(+ (- *	ABC*DEF^/	
17.	G	(+ (- *	ABC*DEF^/G	
18.)	(+	ABC*DEF^/G*-	Pop from top on Stack , that's why '^' Come first
19.	*	(+ *	ABC*DEF^/G*-	
20.	H	(+ *	ABC*DEF^/G*-H	
21.)	Empty	ABC*DEF^/G*-H*+	END

Resultant Postfix Expression: $ABC*DEF^/G*-H*+$

Code screen shot

```
#include<stdio.h>
#include<stdlib.h>
#include<string.h>
#define SIZE 100
